

## Instructions for updating and Immunizing files in Spybot.

1. Open the Spybot control panel by right-clicking on the Spybot icon found in the system tray and selecting “Run SpyBot-S&D” from the menu which pops up. (You can also open the SpyBot control panel through the Start button at the bottom of the screen: Start/All Programs/SpyBot – Search & Destroy/ SpyBot – Search & Destroy)

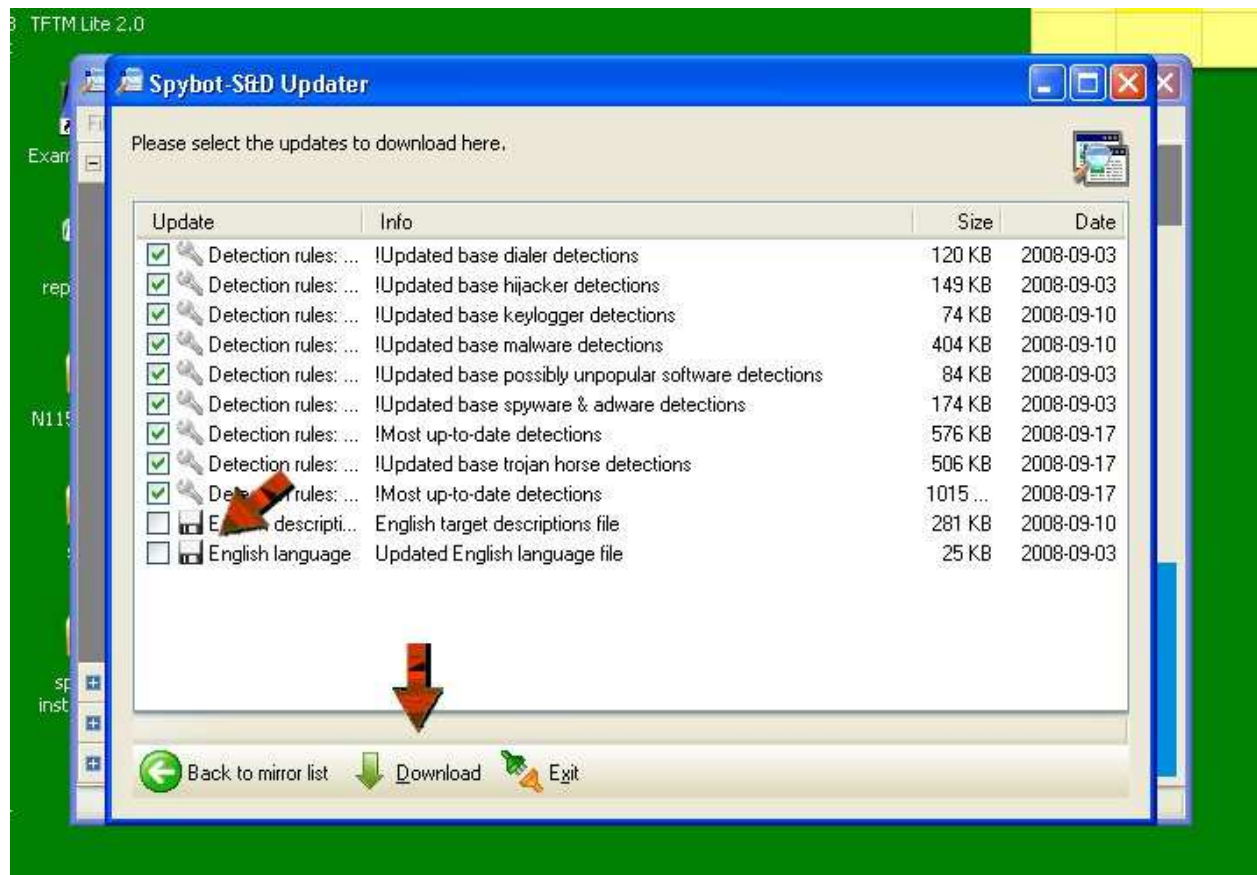

2. Click on the button that says “Search for Updates.”

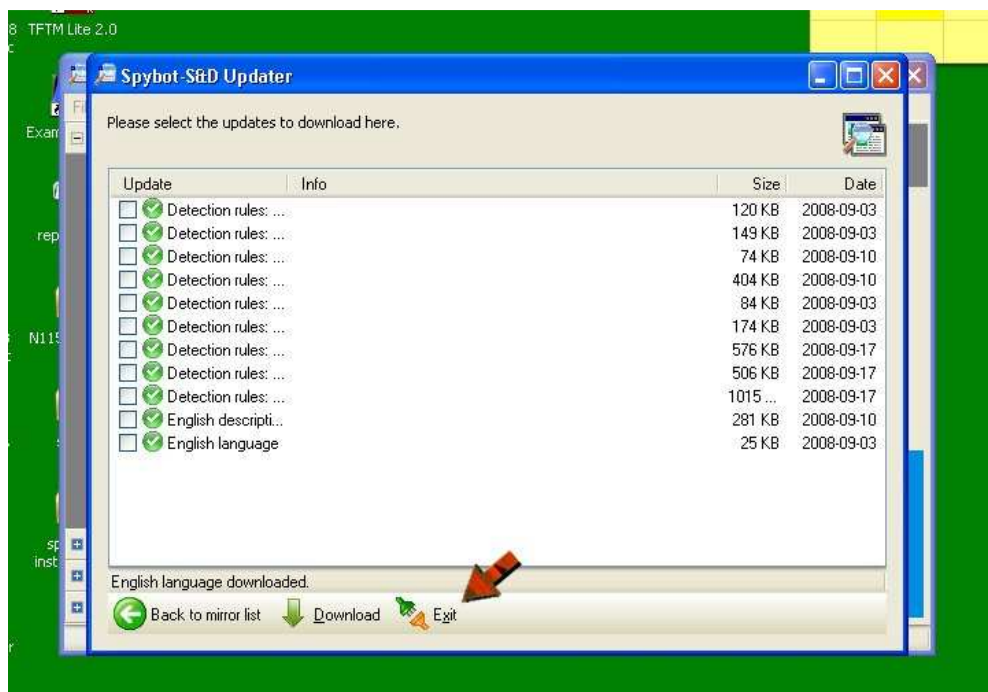

3. You will be told if there are no new updates. If so, you are done. If there are new updates, you will see a window with a list of download sites from which you can obtain the updates. Click on any of these sites (it doesn't matter which one) and then continue.

4. You should go ahead and download all available updates. Click on any boxes that do not have a green check mark in them. We want every box to have the green check mark. Then click on Download.

5. If the download proceeds successfully you should see green circles with white check marks next to each item. If you see any red “x’s” then click on “Back to Mirror List” and click on a different download place, and try downloading the files again. Keep repeating the process until you see nothing but green circles with white check marks. At this point, click on Exit.

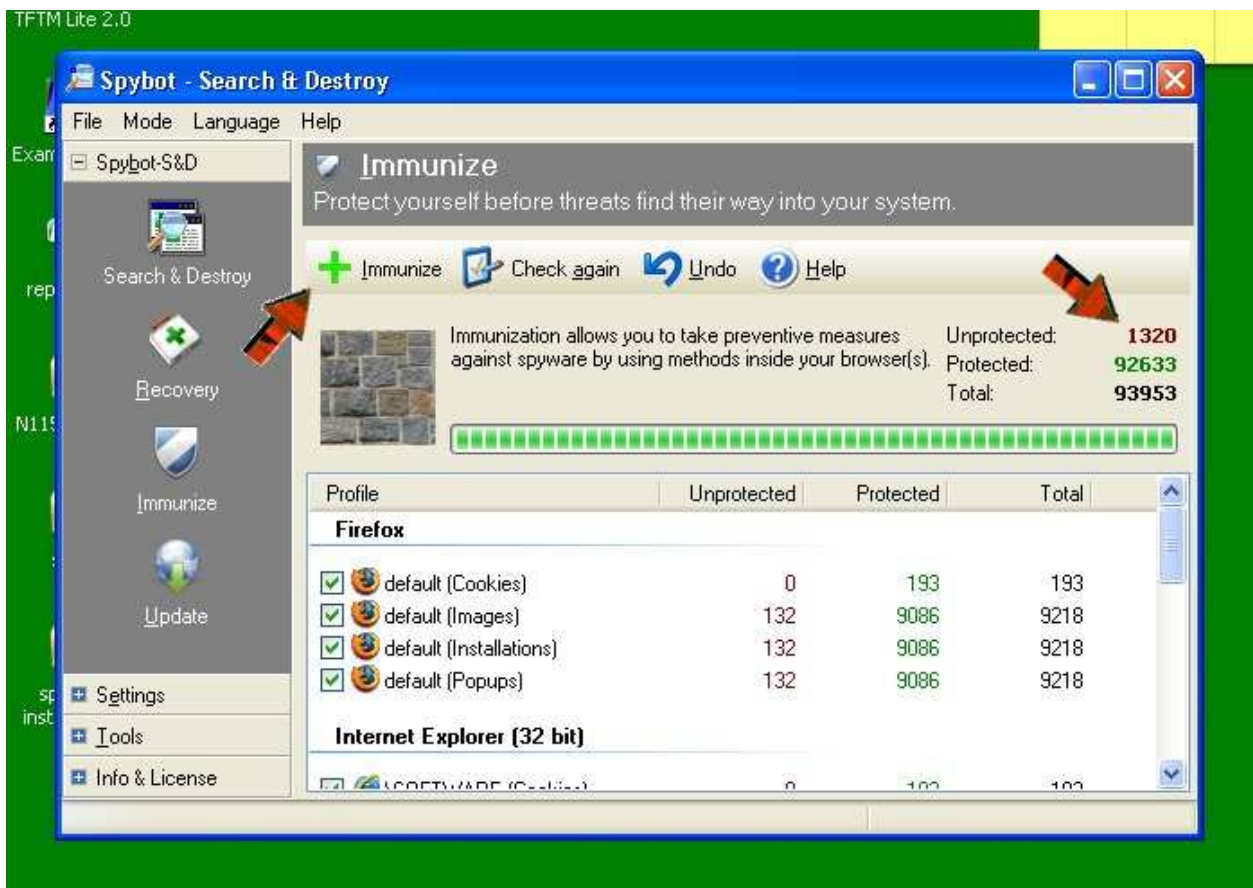

6. You should now again see the Spybot control panel. Click on the Immunize button mid-way down the left side of the control panel.

Spybot will now scan your system looking for unprotected files.

7. Spybot will tell you how many unprotected files it found when scanning your system. You will now need to immunize against these files. Click on the Immunize button next to the green plus sign.

8. When Spybot is finished you should have 0 unprotected files. You're now done updating and immunizing files with the Spybot program. Now just click on the red "X" at the top right to close the Spybot control panel.
